

Clinical Document Exchange

What is Clinical Document Exchange?

Clinical Document Exchange allows different healthcare organizations to exchange patient records. Your participation allows other providers you see to obtain your patient records for treatment purposes.

For example, your child is seen by a specialist or in the Emergency Room at another hospital. That provider can quickly access your child's records to find out what medications your child is taking, or that they have a medication allergy.

How much of my data is being shared?

Your most up-to-date Summary of Care record is made available and contains information including:

- Demographic data (name, date of birth, address)
- Clinical data
 - Diagnoses
 - Allergies
 - Medications
 - History of Procedures
 - Diagnostic and Laboratory Test Results
 - History of Immunizations
- Insurance Policies

Who has access to my data?

Only providers at healthcare organizations that participate in Clinical Document Exchange through the interoperability framework Carequality are able to retrieve your records. They may retrieve your records for treatment purposes *only*.

How is my data secured?

In accordance with industry standards many layers of security, including encryption, protect patient data when it is transmitted to a different healthcare organization.
